Research Database: Video Trace Library

1. Created extensive library of traces of video frame sizes, which are essential for quantitative studies of network protocols and mechanisms for video transport over the Internet. Our video trace library, which is the **largest video traffic database worldwide**, is publicly available from our server at `http://trace.eas.asu.edu` and is widely used by networking researchers. The trace library generates over **77,600** results on Google as of November 2012.

Developed and assessed a computer-based instructional module that (*i*) introduces middle and high school students without any prior content specific knowledge to the principles of electrical circuit analysis, and (*ii*) has been quantitatively demonstrated to be effective in teaching the basic principles of circuit analysis and to increase motivation for further study in electrical engineering. Introduced over 80 middle and high school students in 2007, over 300 middle and high school students in 2008 and in 2009 to electrical circuit analysis with the module.

Web–based Teaching Aids for Communications Networks

Developed interactive Java applets that illustrate key networking concepts with students in my EEE 459 Communication Networks class. Three of the developed applets have been accepted for publication on the Addison-Wesley companion web site of the third edition of the standard networking text *Computer Networks—A Top–Down Approach Featuring the Internet* by J. Kurose and K. W. Ross (`http://wps.aw.com/aw_kurose_network_5`).

Multimedia QoS Networking Course

Developed new course on fundamentals and current trends in multimedia networking with quality of service support. The course was offered in the fall 2003 semester for the first time; this offering was exclusively for on-campus students. For the fall 2004 and future offerings, the course has been evolved into a novel hybrid format that accommodates both on-campus students and distance learners and combines web-streamed video lectures with on-line instructor moderated student activities.

Learning Community Building Team Design Project for EEE 459

Developed a novel team design project for EEE459/591 Communication Networks course that (*i*) fosters the forming of learning communities among on-campus students and distance learners, and (*ii*) employs authentic learning to introduce students to the topic of network security.

Computer-based Instructional Module on Principles of Multimedia Networking

Developed and assessed a computer-based instructional module that (*i*) introduces senior level college students to the principles of multimedia networking in the Internet, and (*ii*) has been quantitatively demonstrated to be effective in teaching the basic principles of multimedia networking and to increase the motivation for further study in multimedia networking.
