My work aims to improve our understanding of why people with neurological conditions fall, and ways to reduce the frequency of future falls. To achieve this goal, my lab conducts human-subject research to 1) characterize balance deficits, 2) understand control of balance, and 3) develop & assess fall-prevention rehabilitation interventions. We engage an interdisciplinary team of engineers, neuroscientists, neuropsychologists, & clinicians. These collaborations ensure our work is guided by a theoretical framework and remains translatable to the clinical community. Our goals of reducing falls and improving quality of life support the mission of the College of Health Solutions to "make meaningful contributions to the health and well-being of society".
